

Seeking Mechanical Engineers to join our team

This position is assigned to the Mechanical Engineering Department and is responsible for the design of semiconductor capital equipment involving static and dynamic design and the analysis of mechanical systems, components, and packages for capital equipment. To support design activities for new and modified designs, the incumbent will interface effectively with all product development cross-functional teams and drive detailed engineering, design, validation and manufacturing documentation.

RESPONSIBILITIES

- Perform world-class mechanical engineering design and validation of semiconductor reactor and support systems according to functional and engineering specifications that meet performance, quality, reliability, cost and schedule targets.
- Drive the generation of engineering design specifications required to develop state-of-the-art thin film technologies.
- Evaluate concept alternatives in a methodical and structured manner, and provide recommendations of best alternatives for engineered solutions.
- Work effectively in a cross-functional team environment with internal and external partners to develop new hardware for state-of-the-art thin film deposition technologies.
- Work closely with other Mechanical Engineering Staff and Supplier Engineering Function, as well as supervise vendors, for robust manufacturing of semiconductor reactor components and support systems.
- Develop testing criteria and execute validation of engineered designs.
- Ownership and accountability for the generation of detailed engineering documentation required to effectively manufacture components and subsystems in a volume manufacturing and prototype basis.
- Technical leadership and mentoring of other Mechanical Engineering colleagues in the organization.
- Contribute to efficiency improvements of engineering best practices.
- Continued self-improvement of skills.
- Other duties as assigned.

...Continued from page 1

REQUIREMENTS

- BSME or MSME with 5-plus years of semiconductor experience.
- Solid understanding of semiconductor reactor components/subsystems, and support systems.
- *Proven track record of:*
 - Technical leadership for a small group (1-2) of engineers with the ability to provide guidance to other engineers.
 - Generating and executing program schedules thoroughly and on time.
- *Proficiency in:*
 - Major CAD/CAE Engineering Tools.
 - Pro-E, AutoCAD & NX and geometric tolerance standards and tolerance stack up analysis methods.
- Proven problem-solving skills – either intuitive or based on structured methods (Fish Bone, 8D, 5 Whys, etc.)
- Familiarity/proficiency in Basic FEA for Structural and Thermal Design.
- Ability to effectively work in a highly leveraged, fast-paced team environment.
- Proficiency in new product development design best practices, including a structured design engineering process AND design validation.
- Ability to manage his/her own time and projects.
- Positive 'Can-Do' attitude and energy.

HIGHLY DESIRED

- Advanced Degree in relevant field of study.
- Familiarity/proficiency in MOCVD/ALD Technology Systems, Components and Engineered Designs.
- Proficiency in Pro/E, Pro/PDM and/or Pro/INTRALINK, FMEA experience, Variational Analysis Methods, DOE methodologies, Structured Trade-Off Analysis Methods.
- Familiarity with Advanced FEA Structural and Thermal Design, CFD, Multiphysics, etc.
- Design for Reliability methods (Weibull, etc.) MATLAB, Labview, etc.

If you or anyone in your network wishes to rejoin/join our talented technical team, please contact Dinesh Kavadapu at dinesh.kavadapu@mindteck.com as soon as possible.
